

Neets and YIT makes education easy in Norway

The new Jåttå School in Stavanger, Norway is filled with easy to operate audio visual equipment because of Neets and YIT.

The AV industry is growing from “nice to have” to a necessity in many industries and the school market is no exception. Many class rooms are being equipped with interactive boards, electric screens, projectors, active speakers, electric curtains and so on. This was also the case for Jåttå School in Stavanger, Norway. The school is new and the request was audio visual equipment in all 39 class rooms.

This request was fulfilled by YIT, Norway’s leading supplier in technical building installations. YIT and the schools representatives sat down and agreed on what kind of needs and requests they had for the project. Some of the keywords were simplicity and low user interaction. Even though the order did not request any kind of control systems YIT convinced the school representatives that Neets Control – FoXtrot was the solution, making this project absolutely intuitive and user friendly. “We sold the Neets Control – FoXtrot for all the rooms so that there will be no need for remote controls for the audio visual equipment, making the installation as user friendly as possible”, says YIT’s Ronny Isaksen.

Each room consists of a screen, a projector and active speakers. Neets Control – FoXtrot controls the screen up/down, the projector on/off and source select and volume. Besides these functions YIT has programmed Neets Control – FoXtrot to shut down all equipment, if the room has not been used in 4 hours. This way Neets Control – FoXtrot saves lamp and filter hours on the projector and electricity in general. As YIT’s Ronny Isaksen states; “this electricity saving function in Neets control systems is a feature that we use a lot in our projects. The customers like this function because it saves them money in the long run.”

Both Jåttå School and YIT are very happy with the solution. “We use Neets control systems in 99 % of our installations, because the systems makes the interaction required by the user very intuitive and straight forward” says Mr. Isaksen,
