

# Conference control gets even smaller

The Control Foxtrot is the latest offering from Neets and will be on show on its booth at the RAI. This compact and cost effective control system can access all the functions of large screen projectors whilst at the same time controlling room functions such as lights, projection screens or blinds.

The system can control both RS-232 and IR based devices and, by the addition of a relay box it can switch lights on or off and move screens up and down.

The panel is programmable with windows software and can be simply reprogrammed at a later date to account for new devices or changes in system configuration.

Stand #A100
