

Neets

Neets will use ISE 07 to launch the Neets Control Foxtrot, a system that controls audio-visual equipment in a user-friendly way and at the same time take up very little space.

The Neets Control Foxtrot is the newest product in Neets product portfolio. Though small, the economical control system can access all vital functions of large screen projectors while at the same time controlling the functions of the room (light, projection screen or room darkening).

Unlike competing control systems, the Neets Control Foxtrot has no power ON button. The system starts when the user presses any of the eight keys on the panel. The system controls both RS232 and IR controlled devices. Control of lights on/off, screen up/down and so on can be achieved by connecting a relay box which Neets also provides.

The panel is said to be easy to program with Windows software, and if customer needs change in the future, the panel is easily reprogrammed to take account of new equipment.
